Abstract: We give generalizations and simple proofs of some \( q \)-identities of Dilcher, Fu and Lascoux related to divisor functions.

Let \( a_1, \ldots, a_N \) be \( N \) indeterminates. It is easy to see that

\[
\frac{1}{(1 - a_1 z)(1 - a_2 z) \ldots (1 - a_N z)} = \sum_{k=1}^{N} \prod_{j=1, j \neq k}^{N} (1 - a_j/a_k)^{-1}. \tag{1}
\]

The coefficient of \( z^\tau \) (\( \tau \geq 0 \)) in the left side of (1) is usually called the \( \tau \)-th complete symmetric function \( h_\tau(a_1, \ldots, a_N) \) of \( a_1, \ldots, a_N \). Clearly, we have \( h_0(a_1, \ldots, a_N) = 1 \) and equating the coefficients of \( z^\tau \) (\( \tau \geq 1 \)) in two sides of (1) yields

\[
h_\tau(a_1, \ldots, a_N) := \sum_{1 \leq i_1 \leq i_2 \leq \cdots \leq i_\tau \leq N} a_{i_1} a_{i_2} \ldots a_{i_\tau} = \sum_{k=1}^{N} \prod_{j=1, j \neq k}^{N} (1 - a_j/a_k)^{-1} a_k^\tau. \tag{2}
\]

In particular, if \( a_k = \frac{a - bq^{k+i-1}}{c - zq^{k+i-1}} \) \((1 \leq k \leq N)\) for a fixed integer \( i \) \((1 \leq i \leq n)\), then formula (2) with \( N = n - i + 1 \) reads

\[
h_\tau \left( \frac{a - bq}{c - zq}, \frac{a - bq^{i+1}}{c - zq^{i+1}}, \ldots, \frac{a - bq^n}{c - zq^n} \right) = \frac{c^{n-i+1}(zq/c)_{n-i+1}}{(q)_{n-i+1} (az - bc)^{n-i}} \cdot \sum_{k=i}^{n} (-1)^{k-i} \binom{n-i+1}{n-k} q^{(k+i-1) - k(n-i)} (1 - q^{k-i+1})(a - bq^{k})^{\tau+n-i} \binom{(c - zq^{k})^{\tau+i}}{c - zq^{k}+1}, \tag{3}
\]

where \( (x)_n = (1-x)(1-xq)\ldots(1-xq^{n-1}) \) and \( \binom{n}{i} = (q^{n-i+1})i/(q)_i \) with \( (x)_0 = 1 \).

The aim of this note is to show that (3) turns out to be a common source of several \( q \)-identities surfacing recently in the literature.

First of all, the \( i = 1 \) case of formula (3) with \( \tau = m-n+1 \) corresponds to an identity of Fu and Lascoux [3, Prop. 2.1]:

\[
h_\tau \left( \frac{a - bq}{c - zq}, \frac{a - bq^2}{c - zq^2}, \ldots, \frac{a - bq^n}{c - zq^n} \right) = \frac{c^n(zq/c)n}{(q)_n (az - bc)^{n-i}} \sum_{k=1}^{n} \binom{n}{k} \binom{k-i}{n-k} q^{(k+i-1) - nk} (1 - q^{k-i+1})(a - bq^{k})^{m} (c - zq^{k})^{\tau+i}. \tag{4}
\]
Next, for \( i = 1, \ldots, n \) and \( m \geq 1 \) set
\[
A_i(z) := \frac{q^i(zq)_{i-1}(q)_n}{(q)_i(zq)_n} h_{m-1} \left( \frac{q^i}{1-zq^i}, \ldots, \frac{q^n}{1-zq^n} \right).
\] (5)

Then we have the following polynomial identity in \( x \):
\[
\sum_{k=1}^{n} \binom{n}{k} \frac{(x-1) \cdots (x-q^{k-1}) q^{mk}}{(1-zq^k)^m} = \sum_{k=1}^{n} (-1)^k \binom{n}{k} \frac{q^{(k)+mk}}{(1-zq^k)^m} + \sum_{i=1}^{n} A_i(z) x^i.
\] (6)

Indeed, using the \( q \)-binomial formula [1, p. 36]:
\[
(x-1)(x-q) \cdots (x-q^{N-1}) = \sum_{j=0}^{N} \binom{N}{j} (-1)^{N-j} x^j q^{(N-j)},
\]
we see that the coefficient of \( x^i \) (\( 1 \leq i \leq n \)) in the left side of (6) is equal to
\[
\sum_{k=1}^{n} (-1)^{k-i} \binom{n}{k} \frac{q^{mk+(k-i)}}{(1-zq^k)^m} = \frac{q^i(zq)_{i-1}(q)_n}{(q)_i(zq)_n} h_{m-1} \left( \frac{q^i}{1-zq^i}, \ldots, \frac{q^n}{1-zq^n} \right),
\] (7)
where the last equality follows from (3) with \( a = 0 \), \( c = 1 \), \( b = -1 \) and \( \tau = m - 1 \).

Now, with \( z = i = 1 \) and \( m \) shifted to \( m + 1 \), formula (7) reduces to Dilcher’s identity [2]:
\[
\sum_{k=1}^{n} \binom{n}{k} (-1)^{k-i} q^{k}^{(k)+mk} \frac{1}{(1-zq^k)^m} = h_{m} \left( \frac{q}{1-q}, \ldots, \frac{q^n}{1-q^n} \right) = \sum_{i=1}^{n} A_i(1).
\]

On the other hand, formula (1) with \( N = n + 1 \) and \( a_i = q^{i-1} \) (\( 1 \leq i \leq N \)) yields
\[
\sum_{k=0}^{n} (-1)^k \binom{n}{k} q^{(k)+k} \frac{1}{1-zq^k} = \frac{(q)_n}{(z)_{n+1}}.
\]

Hence, setting, respectively, \( z = 1 \) and \( m = 1 \) in formula (6) we recover two recent formulæ of Fu and Lascoux [4] (see also [5]):
\[
\sum_{k=1}^{n} \binom{n}{k} \frac{(x-1) \cdots (x-q^{k-1}) q^{mk}}{(1-q^k)^m} = \sum_{i=1}^{n} (x^i - 1) A_i(1),
\] (8)
and
\[
\sum_{k=0}^{n} \binom{n}{k} \frac{(x-1) \cdots (x-q^{k-1}) q^{k}}{1-zq^k} = \frac{(q)_n}{(z)_{n+1}} \sum_{i=0}^{n} (z)_i x^i q^i.
\] (9)
